DESCRIPTION

The M74HC368 is an high speed CMOS HEX BUS BUFFER 3-STATE OUTPUTS fabricated with silicon gate C^2MOS technology.
This device contains six buffers, four buffers are controlled by an enable input ($\overline{G1}$) and the other two buffers are controlled by the other enable input ($\overline{G2}$); the outputs of each buffer group are enabled when $\overline{G1}$ and/or $\overline{G2}$ inputs are held low, and when held high, these outputs are disabled in a high-impedance state.
All inputs are equipped with protection circuits against static discharge and transient excess voltage.

1) C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to Test Circuit). Average operating current can be obtained by the following equation. $I_{CC(opr)} = C_{PD} \times V_{CC} \times f_{IN} + I_{CC}/6$ (per Channel)
